### Description

NR2F6 (Nuclear receptor subfamily 2 group F member 6) is a nuclear zinc-finger orphan receptor which acts as a critical PKC (protein kinase C) substrate and essential regulator of CD4(+) T cell activation responses. It inhibits NFATC (Nuclear factor of activated T-cells) transcription factor DNA binding and subsequently its transcriptional activity. It acts as transcriptional repressor of IL-17 expression in Th-17 differentiated CD4+ T cells and may be involved in induction and/or maintenance of peripheral immunological tolerance and autoimmunity. It is involved in development of forebrain circadian clock.
